INTRODUCTION TO GIT

- Introduced in the year of **2005**.
- Author: Linus Torvalds.
- Written in: C programming and programming scripts written in shell script and python.
- Operating system: Linux, Mac OS, Windows.
- License: GPL/ GNU [general public license].
- Website: git-scm.com

WHAT IS GIT?

- Git is open source tool.
- Distributed version control system.
- It is designed to handle minor to major projects with high speed and efficiency.
- It is developed to co-ordinate the work among the developers.
- Git is the foundation of many services like git hub and git lab.

WHY WE NEED GIT?

DATA INTEGRITY

- Git is developed to ensure the security and integrity of the content being versioned.
- While transferring data it will always make sure that there is no data loss.

TRENDY VERSION CONTROL SYSTEM

- Git is the most widely used version control system.
- It has maximum project among all the VCS.
- Due to its amazing workflow and features.

EVERYTHING IS LOCAL

- All operations of the git can be performed locally.
- This is a significant reason for the use of git.
- Internet is not mandatory.

COLLABORATE TO PUBLIC PROJECT

- There are many public projects available on the git hub.
- We can collaborate on those projects and show our creativity to the world.
- Many developers are collaborating on public projects.
- Collaboration allow us to stand with experience developers and learn a lot from them.

FEATURES OF GIT

Open Source

Source code is available for the users.

Scalable

When number of users get increased the git can easily handle such situations.

Speed

Git is very fast, so it can complete all the task in a while, most of the git operations are done on local computer, so it provides high speed.

Maintains Clean history

It is one of the most helpful features of git. Git maintains a clean history of the project.

Distributed

Means that instead of switching the project to another machine, we can create a copy of the entire project.

Changes just stored in local repository, if necessary we can send these changes to the remote repository.

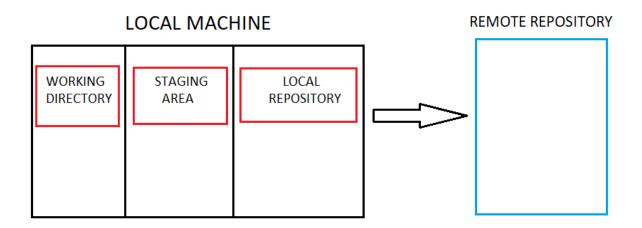

Customization is possible

Users can do customization according to their requirement.

BENEFITS OF GIT

- Saves time.
- Offline working.
- Undo mistake.
- Track changes.

STAGES OF GIT / GIT ARCHITECTURE

Working Directory

This is the place where we do file management operations such as creating files, modifying files, deleting files.

Staging area

It acts as temporary storage to save the files temporarily.

Repository

It is nothing but folder, where we store our files and folders.

Local repository

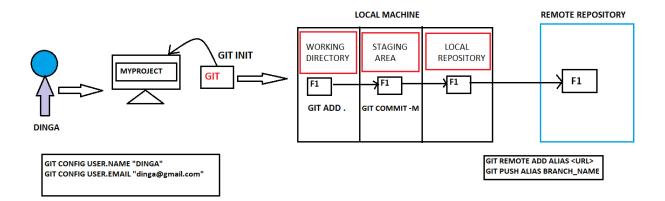

It is a repository which is present inside your laptop, pc.

Remote repository

files and folders are stored in some remote location or some server is called remote repository.

Such as: GITHUB, GITLAB, BITBUCKET.

WORKING FLOW OF GIT

- 1. Create one folder.
- 2. Go inside of that folder.
- 3. Right click, open git bash
- **4.** To initialize git inside this folder run git init command.
- 5. Do configuration by giving user name and email.

```
git config - -global user.name "name"
git config - -global user. email "name@gmail.com"
(or)
git config user.name "name"
git config user. email "name@gmail.com"
```

- **6.** To move files from working directory to staging area run the below command.
 - -To add specific file git add filename
 - -To add all files git add.
 - -To add files with certain extension git add *.extension

Examples
$$\rightarrow$$
 git add *.java \rightarrow git add *.py

7. To move files from staging area to local repository git commit -m "message"

To commit particular files git commit filename -m "message"

- 8. To seen .git hidden files ls -a
- 9. To see the history of commits done git log
- 10. To link local repository to remote repository git remote add alias [remote repository <url>
- **11.** To send files from local repository to remote repository **git push alias branch_name**

DIFFERNCE BETWEEN GIT, MERCURIAL AND BAZAAR

GIT	MERCURIAL	BAZAAR
1. Git is an Open source tool.	1. Mercurial is Open source	1. Bazaar is also an Open
	tool.	source tool.
2. Git provides more	2. Mercurial will also	2. Bazaar provides low
security.	provides more security.	security.
3. Git is very fast.	3. Mercurial is little bit slow	3. Bazaar is not much as fast
	compare to Git.	as Git.
4. Git supports Branching	4. Supports Branching and	4. Bazaar supports branching
and Merging.	merging but not much as git.	only upto some extent.
5. Git have Staging area.	5. No Staging area.	5. No staging area.
6. Git maintains a Clean	6. Mercurial also provides	6. Bazaar will not provide
history of code.	clean history.	clean history compare to git.
